

Actual second derivative of the original action density
Fourier Hessian: $K_{\text{nat}}(p) = H_{289}(p)$; the same original constrained Green

Q5 · Five origin modes and the full four-momentum Schur

Five modes; 98D coordinate complement
 $98 = 45 + 21 + 32$
 $p \in \mathbb{C}^4$; $\det A(p) \neq 0$
The source generates a nonempty domain near 0

Exact Schur; field and source recovery maps
 $E(p), L(p), N_{\text{eff}}(p), G_c(p)$
 $E c = L s$; $x = N_{\text{eff}} c + G_c s$
Full rational identity in four complex momenta

Actual current → cleared Green → all 289 original fields
Ward co-source $\kappa = F(-p)^T J$; the cleared original equation retains the same $d(p)$
Full recovery: contact + active (5 + 98) + nine null directions; the original field and source return together

Q6 · Original configuration preparation: form the complete ordered five-factor word

Left time
 $V_\rho(t)$

Left inverse
 $R_+(\rho h(0))$

Raw / Noether
 B_{raw} / N_f

Right inverse
 $R_-(\rho h(0))$

Right time
 $U_\rho(t)$

Five actual variations: two time, two inverse, each reader contact; evaluate the full word

Original readout: real-field half-axis operator
 $\mathcal{J}_\infty: \mathbb{R}^{289} \rightarrow \mathbb{C}^{289}$
Independent z/w ; $\text{Im } z, \text{Im } w \neq 0$
 $\text{Re } \lambda > 0$; $t \geq 0$; initial co-source retained
Full real-linear operator; operator-norm tail

Actual creation and its original background
Original v_ε ; created unit u_ε ; $z = w = \zeta$
 $\ell(A) = - \langle u_\varepsilon, A u_\varepsilon \rangle + \langle v_\varepsilon, A v_\varepsilon \rangle$
Same nonlinear ordered kernel; original Euler sign
Two real quadratures → full complex signal

Full time-source readback
Original time jets: 0 / 1 / 2
Finite window: bulk $- [B_\lambda(T) - B_\lambda(0)]$
Half-axis: bulk $+ B_\lambda(0)$; terminal tends to zero
The original source equation recovers all 289 rows

The full 289×289 response
Nonlinear source: $0 \leq T < \tau(d, k, P, a)$
Mother Euler derivative: $[W_T K_{\text{nat}}(P) - \Pi_T] a$
Linearized half-axis: $\Delta = \text{Re } \lambda - \gamma(P) > 0$
Full Π_∞ exists, with an operator-norm tail

Same H / Green: the actual quantum forcing returns to all 289 fields
Actual readout: $j_T = \Pi_T a$; original readout: $j_\infty = \mathcal{J}_\infty f$
Original regular domain: $x = \mathcal{A}(P_k) j$; retain the Green contact part and all nine compatibility co-sources
