

Same obligation after revision

§7–§9

the minimal extension keeps old ledger,
facts and theorems; new direction =
the new row consumed by the first write.

$$C_\eta = L_+ \sqcup \{\star_\eta\}$$

Theorems 7.7, 8.4, 8.6, 8.7, 8.12, 9.5

revision input:
typed revision,
field grounding

the old expressions cannot denote a registered demand: after revision, is it the same obligation?

Same obligation

§6

old rows kept unchanged; exactly one
row added on activation; payment
strictly lowers the budget.

$$\beta_{\text{target}} < \beta_{\text{source}}$$

Proposition 6.4; Theorems 6.7, 6.10

general debts:
same-debt
master law

once the occurrence writes the ledger: which row carries the old debt?

Same occurrence

§5

each faithful implementation matches
the root's occurrences; the comparison
is generated by the common occurrence.

$$\varphi_2 \circ \varphi_1^{-1}, \text{ pointwise unique}$$

Proposition 5.2; Theorem 5.3

one source process, several implementations: which event is which occurrence?

Same source object

§2–§4

one witness gives the whole history;
each tick's (old, effect) difference
is explained by that tick's relations.

$$\text{range}(\text{rel}_\rho) = \ker(\text{ev}_\rho)$$

Theorems 3.9, 4.4, 4.6, 4.7; Proposition 4.8

equal readings, different source words: no word reads 0, 0, 1 (Example 4.1)

Same reading

§1.1 · Example 4.1

two words take equal values
under one observation; checked
tick by tick, and the weakest.

$$\text{ev}_0(0) = \text{ev}_0(x) = 0$$

only the old values agree at the junction
