

A Inverse limit at a fixed start

B Shift along the source successor

canonical images of source words satisfy $T([w]_s) = [w]_{\sigma s}$; a completion element consists of all compatible finite readings.

every completion element z satisfies $\text{old}_i(Tz) = \text{old}_i(z) + \text{eff}_i(z)$ tick by tick, whether or not z comes from a source word (Theorem 4.7).
